

SecurityQuestionEvaluator

Goal

- Provide a way for people with no background in computer security to gain insight on the security level of security questions.
- Provide insight to users on how much information can be divulged from a small source of public information.

CHECKPOINTS

1. [x] Research Paper
2. [x] Lightning Talk
3. [x] Meet with professor
4. [x] Final Product

How To Run

This flask app runs on Python 3. When I downloaded Python 3 it makes me use "python3" in the shell to run it, some people may only need to use 'python'. You can use pipenv to install dependencies and activate the shell-

```
python3 -m pipenv install
python3 -m pipenv shell
```

Next navigate to the folder with the file app.py and run

```
PORT=5000 python3 app.py
```

Then go to <http://127.0.0.1:5000/> to see the index page
